Collect a fee (decreasing to 0 over time) which is used to subsidize a prediction-market over the networks cryptographic security.

Every zk project released to date (familiar to me) has had a critical security vulnerability (Tornado Cash, Zcash, Aztec, to name a few).

Security is hard, therefore I expect most empires to fall.

Market settlement is done centrally (pick your poison), but can be challenged (with sufficient capital) into an open L1 validator vote.

This (anti-)upgrade mechanism is designed to make security trade-offs of migrations legible to users.
