

We should unite as the community that we are and create a master contract where it can only be accessible through UNI

(Token # 1) and only long-term committed users can access (1 year minimum of permanence within the contract), thus increasing the price of UNI

since people will look for a way to get UNI to be able to enter into the contract and by remaining blocked within it, we reduce the supply available in the market and increase the demand for it, thus causing an increase in the price of UNI.

Only the addresses that deposited their UNIs in the master contract will be able to provide liquidity in pools for UNI holders, this will help us eliminate arbitrage traders.

People who deposit their UNIs in the master contract will receive Token # 2 distributed decentrally, these tokens will be necessary to be able to introduce liquidity in the future pools.

As the master contract (token # 1) remains blocked, the liquidity leak cannot exist since it is an ecosystem that can only grow in terms of liquidity contained within it.

The liquidity introduced in the master contract (the UNI's) will be used as the community decides (1/3 of it will always remain blocked to redeem the # 3 tokens), this liquidity can also be used to increase the value of the contained liquidity within the vaults of token # 2, further increasing the price of the base of our master contract (UNI).

The liquidity they introduce with token # 2 will be used to create loan services such as Aave, as well as to provide liquidity to many decentralized and even centralized exchanges.

The rewards for providing liquidity will be distributed through token # 3 and 1/3 of these can be claimed daily in the form of USD, thus providing a basis to avoid the sudden lack of liquidity, in addition to the liquidity providers in an easy way and sure to keep your investment growing.

As the master contract grows, we will absorb liquidity blocked for a certain time, thus also reducing the circulating amount of the coins introduced into the vault, thus increasing their price, since the same e exists in the external ecosystem. even higher demand.

In the pools of token # 2 we can enter BTC, USD, ETH, Gold, and even Company shares, and real state assets. thus creating a more stable ecosystem.

After the time frame of master contract expires, users can redeem their full rewards plus their inicial Investment.

TLDR;

Create a filter contract for UNI holders and make it a full Decentralized ecosystem wich can only be accessed through UNI, increasing UNI price, UNI staked will be blocked, or leveraged, or another Strategy the Community decides
