Get started with the Bundler & Paymaster in seconds

## ZeroDev Template

GitHub Repo implementing Gelato +[ZeroDev](#) to gaslessly deploy a Smart Wallet and increment a counter. The repo contains a quick start guide in the README. To generate a 1Balance API Key, please refer to [1Balance & Relay](#).

The example uses `amaxFeePerGas=0` override which allows transaction fees to be accurately settled post-execution rather than by the `EntryPoint`.

This reduces our on-chain footprint leading to gas savings and avoids overcharging users (e.g., `preVerificationGas`). ?
