

Hi Team, I am running the flashbots block builder on holesky using the flashbots boost Relay. I know, I have to change `genesis_fork_version`, `genesis_validators_root`, `bellatrix_fork_version`, `remote_relay_endpoint`, and `secondary_remote_relay_endpoints` to run the builder on the mainnet. If I use the flashbots boost relay as the remote relay endpoint would it accept blocks from my builder? Should new builder need any pre-registration or meet any other requirement to send blocks to the Flashbots mainnet Relay? Thanks.
