

Yeah, it's a bit strange, but your predictions should be real-valued continuous like the example file, and not just the 5 values in the targets. You are not scored on error, but on ranking correlation, so the first thing that happens is your predictions are ranked and any ties eliminated. If you submit only with those 5 values, you may suffer, you may gain, but there will be a big random component to your scores so you probably don't want that...
