

(as the social network owned he-who-shall-not-be-named, but with “Z” for private

)

Basic concept: Twitter, but decentralized and privacy-preserving, with full algorithmic transparency (and no ads necessary).

(name TBD and can be changed)

Components:

- “Follower” relationships (tracked in the DAG)
- Encryption of messages to your followers
- Flexible delegation of storage and compute
- With some personal servers, can basically act like Twitter
- For those who connect less frequently to the net, acts a bit more like SSB
- With some personal servers, can basically act like Twitter
- For those who connect less frequently to the net, acts a bit more like SSB
- Locally controlled and shareable algorithms for ranking and sorting
- Full local interface control

cc [@apriori](#) for your context - does this make sense?
