About

I'm a researcher and consultant fascinated with the Uniswap protocol.

My approach for the DAO governance is to look at the data (where possible) before making any decisions, and aim to increase the robustness, decentralization, sustainability, and transparency of the Uniswap's ecosystem and its governance. My aspiration is that both the Uniswap protocol and the DAO should be models for the rest of this industry.

I'd support

- Cautious progress with the fee switch, with slow rollout and carefully designed experiments.
- Creating committees and focused groups within the DAO for specific tasks, similar to the Deployments Accountability Committee.
- Funding initiatives and friendly forks — only support those that clearly benefit the protocol ecosystem. Public goods funding is important, but keeping Uniswap credibly neutral is more important.
- Measures that add more transparency & accountability to the UF and its grants.

Why me?

- I'm deeply familiar with the technical aspects of Uniswap, and have been involved in its ecosystem since 2021. This includes writing a Uniswap v3 math explainer that is widely read in the dev community; consulting builders and LPs; answering questions in Stack Overflow and the Uniswap discord; writing on LP strategies as part of a UF's grant.
- I have some real-world governance experience as the chairman of the scientific council in my research institute, and a solid reputation and professional accomplishments in my career outside of crypto (>1000 academic citations for my work, h-index around 20).
- Last but not least, my potential conflicts of interest are minimal, as I am not professionally affiliated with any DeFi companies, protocols or other DAOs, aside from owning a small company of my own that assists developers within the Uniswap ecosystem.

In my view, LPs are the most important stakeholders in the Uniswap's ecosystem. Without LPs there's no liquidity, and without liquidity there's no trading. In order to make DeFi competitive with centralized exchanges, the LP experience and opportunities must be improved. Furthermore, this must be done in a way that keeps the door open for retail and passive LPs, ensuring that democratic and decentralized participation remains an option.
