

# Oracles reference

KNOW MORE TOOLS? See something missing? Let us know on the [Arbitrum Discord](#) or by [opening an issue on GitHub](#) . The following [oracles](#) will help you integrate off-chain data into your decentralized apps (dApps):

Name	Description	Example/Documentation
Chainlink	Chainlink is a widely-recognized Web3 services platform specializing in decentralized oracle networks. It enables building Ethereum and Arbitrum dApps that connect to a variety of off-chain data feeds and APIs, including asset prices, weather data, random number generation, and more. <a href="#">How to use Chainlink</a>	API3
API3	API3 is a collaborative project delivering traditional API services to smart contract platforms in a decentralized and trust-minimized way. It offers technology for Airnodes to push off-chain data to on-chain contracts, and the data can be queried directly through Airnodes or dAPIs. <a href="#">How to use API3</a>	Tellor
Tellor	Tellor is a decentralized oracle network that incentivizes data reporting and validation. It supports a range of data types, including basic spot prices, sophisticated pricing specs (TWAP/VWAP), Snapshot Vote Results, and custom data needs. <a href="#">How to use Tellor</a>	Supra
Supra	Supra is an Oracle & IntraLayer offering a toolkit of cross-chain solutions such as data oracles, asset bridges, and automation networks. It aims to interlink all blockchains, whether public (L1s and L2s) or private (enterprises). <a href="#">Supra Overview</a> <a href="#">Edit this page</a>	Last updated on Mar 22, 2024
