

Store keys in AWS Secrets Manager

You can use Tesseract to generate a private and public key pair in AWS Secrets Manager. You must have [AWS Secrets Manager configured and running](#).

The following example generates a private and public key pair and saves them to AWS Secrets Manager with IDs `Pub` and `Key`, and endpoint:

`tesseract -keygen -keygenvaulttype AWS -keygenvaulturl` The `-filename` option can be used to specify alternate IDs. Multiple key pairs can be generated at the same time by providing a comma-separated list of values:

`tesseract -keygen -keygenvaulttype AWS -keygenvaulturl -filename id1,id2` You can [configure Tesseract to use AWS Secrets Manager keys](#). [Edit this page](#) Last updated on Oct 9, 2023 by [dependabot\[bot\]](#) [Previous Azure Key Vault keys](#) [Next Generate certificates](#)
