

Hi. I wanted to initiate a discussion on potential applications of Aztec technology, specifically in the context of enhancing privacy in blockchain transactions.

We all know that blockchain provides openness and transparency, but this can also become a vulnerability when it comes to privacy. Built-in privacy features like Aztec can change this dynamic and ensure user security and privacy.

I would love to hear your thoughts on this. What other applications do you see for Aztec? What privacy-related issues can be resolved using this technology?
