

I'm wondering if there is a data file somewhere that contains health factors for all users and all block times. This would be very helpful to analyze questions such as how responsive are liquidators to liquidation opportunities. I know that one can calculate health factor using historical deposit/withdraw/borrow/repay, but the process is extremely complicated, with interest rate compounding being of the part that is hard to be 100% correct. I'm an academic and I want to use the data for academic research, so any help on this would be greatly appreciated.
