

Developer Notes

Can I use the [SDK](#) to submit contract transactions? Not yet, working on it! Should I use the API versus SDK to construct deposit parameters? We [recommend](#) using the API for the easiest way to query suggested deposit params. What is the behavior of ETH / WETH in transfers? Across liquidity pools are filled using WETH but, depending on the context, Across will sometimes send a user ETH and sometimes send a user WETH. * If a bridge transfer is being sent to an EOA, * the EOA will receive ETH * (not WETH) * If a bridge transfer is being sent to a contract, * the contract will receive WETH * (not ETH) [Introduction -Previous Products](#) [Next- Introduction Migration from V2 to V3](#) Last modified 22d ago
