

## Endpoints

Currently, the Bundle API has only one endpoint

- [POST /v1/shortcuts/bundle](#)
- - Bundle a list of actions into a single tx. Returns a transaction that can be submitted to an Ethereum node.

## Authentication

Enso authenticates your API requests using your account's API keys. Getting an API key is easy, and you can create as many as you need from the Enso developers [portal \(opens in a new tab\)](#).

## Actions

The bundle endpoint accepts a list of actions. Users can fetch all the available actions in this endpoint from the [Metadata API](#).

- GET /v1/shortcuts/actions

[Introduction](#) [POST /v1/shortcuts/bundle](#)
