

I've been curious about how strong the meta-model was for quite a while, so thank you for providing the historical predictions.

However, I must say that I'm a bit disappointed after seeing them. I decided to benchmark the meta-model predictions against a plain LightGBM model trained on V4 data from prior (up to 724) eras. The LightGBM model got a spearman score of 0.0268 while the meta-model got a score of 0.0275 (both scored on eras 888-1028). Am I missing something here?
