

Hi everyone, I'm a novice user and looking for some usage clarification. In order to integrate frontrunning protection I've sent a couple of transactions to relay-goerli.flashbots.net

using `eth_sendPrivateTransaction`

method (with `opted builders:["default"]`)

) and got hashes in response. However, they did not applied on-chain and were expired and dropped. My first question here, Is there rpc call "works" on goerli as expected or I have missed something?

My second question here, I mean, I need some clarification, can I use `eth_sendPrivateTransaction`

method for broadcasting from an application, or should I do it in more sophisticated way using bundles

?
