

EnigmaSimulation appears in build/enigma_contracts

once contracts are migrated.

I would like to get some details on what exactly is EnigmaSimulation's role.

Right now from what I see, when I make a call to a secret contract that then calls a smart contract, it will do it under EnigmaSimulation's address.

questions:

- EnigmaSimulation's role?
- Is it unique to every secret contract?
- Is it safe to use that address, for example: send tokens to it, so then the secret contract can send tokens through a smart contract

Thanks
