

On the Main Chain we have Block, Block Header, Block Proposer (similar to a Miner in PoW chain).

But on a Shard Chain do we have:

1. Blocks AND Collations

, i.e. Blocks (Level 2 Object), and Collations (Level 1 Object) (similar to Blocks), since earlier in the Introduction section of the [Sharding Specification](#) it says "... validator could theoretically at any time be assigned the right to create a block on any shard ...". OR

1. Collations ONLY

(as shown in the Table at the end of the Introduction section of the [Sharding Specification](#)
