

callbacks

?

modulecallbacks

?

functionversion_callback

...

Copy version_callback(value:bool)→None

...

Prints the current version when--version flag is added to a call.

Args:

- value
- (bool): represents if the flag has been added or not to the call.
-

Raises:

- Exit
- : exit the CLI execution
-

?

functiondebug_callback

...

Copy debug_callback(_, value:bool)

...

If a call adds the--debug flag debugging mode is activated for external requests and API Clients.

Args:

- _
- (type
-): discarded value
- value
- (bool): represents if the flag has been added to the call or not
-

Returns:

- bool
- : pass the value back so it can be used in the clients
-
