

These are some questions that were asked recently in telegram by user ChicoBermuda

1. What is the liveliness threshold of the secret node network?
2. How many nodes are involved in a computation?
3. Can computations finish if a node goes offline?
4. Why is ENG used to pay for computations instead of ETH or Dai? Based on the Q&A in "Secret Nodes — Everything You Need to Know!", this sounds like an unnecessary bottleneck and a way to force demand for ENG where it's not needed
5. Can network privacy be subverted if I control some plurality of ENG or secret nodes? What's the easiest way to attack the network (seriously)?
