

We, as a DAO, use snapshot constantly. While we have an awesome on-chain governance through tally, Snapshot really helps us in getting sentiment checks on a lot of proposals. The problem we have had, over time, is the limitation of options available to fit our needs. Let's add a few examples.

- elections of council/advisors in L1: users could select 5 members for council, 3 for advisors, some selected just one, some others all the available choices. While selecting only one is something that has a merit, selecting all translated in non legal votes
- ratification of decisions of the council for L1 votes on single protocols: we were constrained in putting up 77 proposals, and delegates have to vote on 77 different snapshots. We could have had, instead, put up for example 5 proposals with 16 options, one for each protocol, saying "yes/no/abstain", so that loading the proposals would have been faster, and voting on proposals, while requiring still time for scrutiny, would have been effectively faster.

These are the 2 main examples that came to my mind, involving

- imposing a minimum/maximum amount of selections in a multi choices snapshot
- create batch voting with no internal weights.

Idea is to discuss here if DAO feels the above is useful, throw in the forum some more potential ideas, contact snapshot, define a cost, write a formal proposal, and then vote and execute. One thing that also has to be discussed is how this would be effectively executed, it doesn't make sense to create a new multisig for this, so maybe we could leverage infrastructure and committee we have now already.

Just to give some context: I have already taken contact with snapshot to understand if the above was possible, and the terms. We are talking accordingly to some initial findings about developments that should take a few weeks in the order of potentially 10-15k USD each. Please don't take the numbers above as any hard promise

on their side, nor anything. This is me just coming forward to have an estimate of the resources (time + capital) that we would need to move it forward on.

If the DAO also finds the above just too much of a burden for the relative low amount, we could likely pursue other roads like questbook to make it done. But again, I am interested in gathering some opinions on the value, after chatting with a few delegates that were positive on it.

You friendly arbitrum cow.
