

Satellite

What is Satellite?

Satellite is a web application built on top of the Axelar Network. It provides an easy to use interface which enables users to transfer their crypto assets from one chain to another.

Getting Started

⚠ Caution: Satellite is used to transfer real assets across main networks. When using it for the first time, try transferring small amounts initially. If you need assistance, use the [FAQ](#) and [Support](#) buttons in Satellite for help. Satellite can be found at <https://satellite.money/>.

For a step-by-step walkthrough on how to use Satellite, check out the following tutorials created by the Axelar Team.

- [Tutorial Video](#)
- [Instructional Medium Post](#)

See [Mainnet resources](#) for a reference list of Axelar's cross chain contract addresses, minimum asset transfer amounts, and cross-chain transaction processing fees.
