

# Ve-Tokenomics

Ve-tokenomics is a pivotal component of ZeroLend's Economy structure. It is designed to reward long-term investment and active participation in governance.

At its core, it involves participants locking ZERO tokens for a predetermined duration, receiving in return vote-escrowed (ve) tokens. These ve tokens not only signify the user's stake but also escalate their benefits proportionally to the lock period.

The longer participants commit their tokens, the higher their rewards and influence in governance decisions.

Why Ve-Tokenomics?

- Ve-tokenomics aligns user incentives with ZeroLend's long-term goals.
- By locking ZERO tokens, the effective circulating supply decreases, which can potentially enhance the token's value over time.
- Committed users receive a stronger voice in platform governance.
- 

With this model, we aim to foster a community of engaged stakeholders, contributing to the stability and growth of ZeroLend.

Ve-Tokenomics Model

ZeroLend introduces a unique ve model that incorporates both:

1. Single Stake ZERO
2. dLP ZERO
- 3.

This dual approach enables users to engage with the platform through direct token staking or by participating in dynamic liquidity provision.
