

I have been going through the VDFs readings list posted by Justin Drake. Here's a link:
<https://notes.ethereum.org/52JZtwErThe9KmN6TNd1lg#>

I noticed that most of the VDFs constructions so far are based on RSA groups or integer ideals. As a lot of in-use cryptography make heavy use of elliptic curve, would it be good idea to try to build a VDF based on elliptic curves?
