

Hey all let's explore something interesting happening right now in Ethereum.

Mumon Ginsen is a token claiming to have solved the Mev "problem" by utilizing

```
function isContract(address account) private view returns (bool) {
```

```
    uint256 size;
```

```
    assembly {
```

```
        size := extcodesize(account)
```

```
    }
```

```
    return size > 0;
```

```
}
```

Now, this isn't anything new. In fact, OpenZeppelin itself uses this here:

<https://docs.openzeppelin.com/contracts/4.x/api/utils#Address-isContract-address->

Now if this is empirically true, I'm curious how this is the FIRST token to try this since 2017?
