

# Keys Management

[##](#) [Basic Key Management Create, import, export and delete keys using the CLI keyring.](#) [##](#) [Multisig](#) A multisig account is a special key that can require more than one signature to sign transactions. This can be useful for increasing the security of the account or for requiring the consent of multiple parties to make transactions. Multisig accounts can be created by specifying: [##](#) [Using TMKMS](#) The Tendermint Key Management System (or TMKMS) should be used by any validator currently or intending to be in the active validator set. This application mitigates the risk of double-signing and provides high-availability to validator keys while keeping these keys on a separate physical host. While TMKMS can be used on the same machine as the validator, it is recommended to be on a separate host. [Previous Asset Info](#) [Next Basic Key Management](#)
