

Bonjour,

First of all, this is my first post, so hello to all!

I wanted to say how excited I am to happen across v4 of dydx recently - I have been keeping a close watch on the decentralised perpetuals space for a while, and I think moving to a full orderbook model is absolutely the right move: better liquidity, tighter spreads, etc. I truly believe that a fully decentralised derivatives exchange will be a game changer, especially as tradfi government enforcement agencies around the world continue to tighten their grip in a desperate attempt to save their doomed fiat currencies.

However, I do have some concerns still in this area:

1. The (only?) trading front end at dydx.trade makes the system vulnerable to takedown, and censorship. For example, if you try to visit dydx.trade from Zimbabwe, you get this msg:

IP/Country Block Because you appear to be a resident of, or trading from, a jurisdiction that violates our terms of use, or have engaged in activity that violates our terms of use, you have been blocked. You may withdraw your funds from the protocol at any time.

1. Validators are not very anonymous. Each one is a potential target for a government order, as that is where is 'exchange' is hosted

Does the roadmap address these issues?

Cordialement, Tresgard
