

Right now, in solidity, there are two ways to check for a contract, via `extcodesize` or by checking if `tx.origin == msg.sender`.  
`tx.origin` is going to be deprecated.

`extcodesize` does not work for contracts calling via their constructor.

This should be fixed. A clear way should be presented to check if an address is a contract OR an user, especially when “user wallets” will have actual code in them in the future.
