

Hey everyone, given the coming conclusion of Lido's slow-rollout period of MEV Boost, this is a draft put together in order to start discussing and then move on to ratification of 2.0 of the Ethereum Block Proposer Rewards policy. There will also be a separate post about the approval of the relays to be used.

The general purpose of the suggested changes is to:

- Set expectation of full-scale rollout of "PBS lite" via MEV Boost for all Node Operators going forward
- Define responsibilities of Node Operators in the case of Relay misbehavior, failure, or otherwise unexpected or non-performant functionality (e.g. what happens if relays provide bad bids, bad blocks, don't unblind timely, etc).
- Define the responsibilities of Relay Operators towards the Lido Protocol and Node Operators

You can view [the full 2.0 draft here](#) and 1.0 of the document (i.e. the currently approved version)[here](#).

Additionally, you can view a "rich diff" version of the proposed changes[here](#) (which I suggest as it makes reviewing the changes a lot easier!). Please submit comments, thoughts, and suggestions in the hackmd document, as comments in Github (or PRs), or as a reply below!
