

How to Run an Avail Light Client

This guide outlines how to set up an Avail light client. You can either:

1. [Run the light client on an existing network](#)
2. [Run the light client locally](#)

Latest release

You can find the latest release binary in the `avail-light` repository.

Repository Latest Release [avail-light \(opens in a new tab\)](#) [v1.7.6 \(opens in a new tab\)](#)

Run on an Existing Network

In this example, you will download the light client and connect to an existing public network.

1. Download the latest Avail light client [release \(opens in a new tab\)](#)
2. that is compatible with your system. The light client is available pre-built for different architectures. If you prefer building the light client yourself, see [build the Avail light client from source](#)
3. .
4. Run the light client with the following pre-defined configuration file:

```
./avail-light-
```

```
--network
```

goldberg 1. If you want to supply your own configuration file (see [reference \(opens in a new tab\)](#) 2.), use:

```
./avail-light
```

```
--config
```

```
config.yaml
```

```
--network
```

goldberg That's it ! You have successfully run the light client and connected to a public network. The light client should similar to the following:

Sample output The client output should look like this:

```
2023-06-04T02:56:31.871284Z
```

```

Build From Source

You can build the light client directly from source.

```
git
clone
https://github.com/availproject/avail-light.git cd
avail-light cargo
```

build

--release Find the resultingavail-light binary in thetarget/release directory.

Next Steps

Run a Full Node

Consider running a full node by following the deployment guide[here](#) .

[Overview](#) [Light Client API Reference](#)
