Migrate to v1

This guide references the major changes between `safe-service-client` and `api-kit` v1 to help those migrating an existing application.

Note: Follow this guide before migrating to `api-kit` v2.

After completing this guide, you can remove `@safe-global/safe-service-client` from your `package.json`.

Adding the new dependency

To add the API Kit to your project, run the following:

```
_10 yarn add @safe-global/api-kit@1.3.1
```

Change your initialization like this:

```
_15 // old _15 import SafeServiceClient from '@safe-global/safe-service-client' _15 _15 const safeService = new
SafeServiceClient({ _15 txServiceUrl: 'https://your-transaction-service-url', _15 ethAdapter _15 }) _15 _15 // new _15 import
SafeApiKit from '@safe-global/api-kit' _15 _15 const apiKit = new SafeApiKit({ _15 txServiceUrl: 'https://your-transaction-
service-url', _15 ethAdapter _15 })
```

`getSafeDelegates()`

The `getSafeDelegates` was updated to accept more filtering parameters. Now, it accepts an object with multiple properties instead of only the `safeAddress` parameter.

```
_10 const delegateConfig: GetSafeDelegateProps = { _10 safeAddress, // Optional _10 delegateAddress, // Optional _10 delegatorAddress, // Optional _10 label, // Optional _10 limit, // Optional _10 offset // Optional _10 } _10 const delegates: SafeDelegateListResponse = await apiKit.getSafeDelegates(delegateConfig)
```

addSafeDelegate()

Parameter object properties were updated as follows:

```
_18 // old _18 const delegateConfig: SafeDelegateConfig = { _18 safe, _18 delegate, _18 label, _18 signer _18 } _18 await safeService.addSafeDelegate(delegateConfig) _18 _18 // new _18 const delegateConfig: AddSafeDelegateProps = { _18 safeAddress, // Optional _18 delegateAddress, _18 delegatorAddress, _18 label, _18 signer _18 } _18 await apiKit.addSafeDelegate(delegateConfig)
```

removeAllSafeDelegates()

The method was deprecated and removed.

removeSafeDelegate()

Parameter object properties were updated as follows:

```
_15 // old _15 const delegateConfig: SafeDelegateDeleteConfig = { _15 safe, _15 delegate, _15 signer _15 } _15 await safeService.removeSafeDelegate(delegateConfig) _15 _15 // new _15 const delegateConfig: DeleteSafeDelegateProps = { _15 delegateAddress, _15 delegatorAddress, _15 signer _15 } _15 await apiKit.removeSafeDelegate(delegateConfig)
```

getBalances()

The method was deprecated and removed.

getUSDBalances()

The method was deprecated and removed.

getCollectibles()

The method was deprecated and removed.
