

Hey there folks!

First off, I'd like to say a big THANK YOU to Hayden Adams and the Uniswap core devs for seriously making financial history. Uniswap is an amazing step towards decentralization of core financial services, and I can't wait to see where it is in a few years! (Finance student here

)

Anyway, I was wondering if anyone here had any thoughts relating to impermanent loss.

Should Uniswap governance work towards mitigating impermanent loss through means like oracles (Bancor V2 I believe) or another creative solution?

Let's have a discussion!

P.S. I'm not actually that well versed in how smart contracts work, including technical limitations of running on chain. If this isn't possible, let me know!
