

We're headed to ETH Denver! Check here for details, and feel free to reach out if you have a project in mind and want to discuss feasibility or other issues ahead of time.

Some things we're really excited about this time around:

- transactional privacy using our Salad API (wallet integrations, dapp integrations in particular!)
- private set intersection / intersection sum (finding the intersection size of two data sets and manipulating associated values)
- private voting

Any projects you would like to see? Suggest them here and we may add them to our list of project concepts for the hackathon.
