

From my testing, `getConflictingBundle` only returns information on one bundle. Does `getConflictingBundle` only return one bundle, and if so which one if more than one conflicts? Does it get the last bundle that was included so the one to beat in terms of priority fee? Also what does `conflictType` mean? I've looked at the source code and it seems like 3 means coinbase payment conflict (priority fee?) and 4 is gasUsed amount of gas used is too high or I didn't pay enough for it?). I'm not sure what the difference between these two are either so I would appreciate any help. Thanks!
