

I think it is necessary for uniswap concurrently to turn on the fee switch and liquidity mining incentive:

1. At present, all DEX have economic models for tokens (repurchase or destruction), which will improve the price of uni;
2. When the expense switch is turned on, the liquidity mining is turned on, and the price increase of tokens is used to replace the expense loss of LP, which will not reduce the locking volume of LP;
3. With the development of L2 and matic in the later stage, lower transaction fee will bring higher transaction volume and higher income benefit to LP. It is time to give the economic model of uni token.
4. If the uni of the team needs to be sold, it can be directly traded and destroyed through repurchase, providing capital liquidity. If it is not sold, the repurchase can maintain the price appreciation, and the uni held by the team will continue to increase in value.

It is hoped that community leaders can put forward specific implementation plans after consideration and approval~
