

Hi all,

I'm learning as much as possible to get ready for the testnet deployment and to have a chance with being selected as a genesis node.

I've deployed an instance of Ubuntu 18.04 LTS Server to VULTR on a bare metal machine. I've successfully installed the Intel SGX driver.

I'm following the instructions for running a testnode from this page, ensuring docker and docker-compose are deployed from the docker repos so they are the latest:

<http://enigma.co/protocol/GettingStarted.html>

I get all the way to running `./launch.bash -t` from the network folder but encounter the following errors:

<https://pastebin.com/gDzijEXt>

Can anyone assist or is it currently not working?
