

Hi,

i'm Marco Negroni (LordMarkDev), Senior Full stack Web3 developer, Tech Researcher, Safe Guardian.

For a project called Allegian, we are evaluating to tokenize physical gold with a proof of reserve; our goal is to get a loan through MakerDAO using this new token as collateral.

I would like to understand if is possible and which way we have in order to achieve this; i was thinking that the most important thing is to link the token to the gold price using Chainlink oracle, but i'm wondering if can be enough for MakerDAO in order to be supported as collateral or if we also need to make for example an Uniswap V3 pool with some liquidity so can be tradable from the beginning.

Thanks in advance
