

Supported Networks - Direct Funding Method

You are viewing the VRF v2 guide - Direct funding method.

To learn how to request random numbers with a subscription, see the [Subscription Method](#) guide.

Security Considerations

Be sure to review your contracts with the [security considerations](#) in mind.

Chainlink VRF allows you to integrate provably fair and verifiably random data in your smart contract.

For implementation details, read [Introduction to Chainlink VRF v2 Direct funding method](#).

Wrapper parameters

These parameters are configured in the VRF v2 Wrapper contract. You can view these values by running `getConfigon` the VRF v2 Wrapper or by viewing the VRF v2 Wrapper contract in a blockchain explorer.

- `uint32 stalenessSeconds`: How long the VRF v2 Wrapper waits until we consider the ETH/LINK price used for converting gas costs to LINK is stale and use `fallbackWeiPerUnitLink`.
- `uint32 wrapperGasOverhead`: The gas overhead of the VRF v2 Wrapper's `fulfillRandomWords` function.
- `uint32 coordinatorGasOverhead`: The gas overhead of the coordinator's `fulfillRandomWords` function.
- `uint8 maxNumWords`: Maximum number of words that can be requested in a single wrapped VRF request.

Coordinator parameters

Some parameters are important to know and are configured in the coordinator contract. You can view these values by running `getConfigon` the coordinator or by viewing the coordinator contract in a blockchain explorer.

- `uint16 minimumRequestConfirmations`: The minimum number of confirmation blocks on VRF requests before oracles respond
- `uint32 maxGasLimit`: The maximum gas limit supported for `fulfillRandomWords` callback. Note that you still need to subtract the `wrapperGasOverhead` for the accurate limit, as explained in [Direct funding limits](#).

Fee parameters

Fee parameters are configured in the VRF v2 Wrapper and the VRF v2 Coordinator contracts and specify the premium you pay per request in addition to the gas cost for the transaction. You can view them by running `getConfigon` the VRF v2 Wrapper:

- The `uint32 fulfillmentFlatFeeLinkPPM` parameter is a flat fee and defines the fees per request specified in millionths of LINK.
- The `uint8 wrapperPremiumPercentage` parameter defines the premium ratio in percentage. For example, a value of 0 indicates no premium. A value of 15 indicates a 15% premium.

The details for calculating the total transaction cost can be found [here](#).

Configurations

VRF v2 coordinators for direct funding are available on several networks. To see a list of coordinators for subscription funding, see the [Subscription Configurations](#) page.

Understand Risks associated with Bridges

If you are using a cross-chain bridge to transfer your LINK tokens, read the [Bridges and Associated Risks](#) guide to understand what cross-chain bridges are and the risks associated with using them.

Ethereum mainnet

Item Value LINK Token [0x514910771AF9Ca656af840dff83E8264EcF986CA](#) VRF Wrapper [0x5A861794B927983406fCE1D062e00b9368d97Df6](#) VRF Coordinator [0x271682DEB8C4E0901D1a1550aD2e64D568E69909](#) Wrapper Premium Percentage 0 Coordinator Flat Fee 0.25 LINK Minimum Confirmations 3 Maximum Confirmations 200 Maximum Random Values 10 Wrapper Gas overhead 40000 Coordinator Gas Overhead 90000

Sepolia testnet

Sepolia Faucets

Testnet LINK and ETH are available from faucets.chain.link. Testnet ETH is also available from several public [ETH faucets](#).

ItemValueLINK Token0x779877A7B0D9E8603169DdbD7836e478b4624789VRF
