

Aave Labs is planning to run a community fire drill in the first week of December 2024 to test and assess the operational resilience of the ecosystem. Unlike the previous year's SEAL Attack Simulation, this drill will not test the engineering team's ability to diagnose an onchain attack. Instead, the goal is to learn more about the workflows, coordination methods, and information exchange during an incident. It has been a year since these controls were last validated, highlighting the importance of periodic testing to ensure the ecosystem's readiness and ability to respond effectively.

The community's involvement is key to this initiative. Aave Labs welcomes interested parties to participate in the fire drill. Please, reach out directly for participation details.
