

What do we think about hosting an ETH validator with a service like Allnodes and StakeFish and setting its withdrawal address to your Eigenpod?

Seems like there would be a few details that would have to be considered by the host. For example Allnodes sends execution rewards to the withdrawal address, so that would be a problem (EigenPods are not supposed to receive validator execution rewards).

What else is there to think about?

I am surprised none of the vals hosting services are supporting EL restaking as an integration yet, I suspect they all will soon enough.
