

hello everyone!

i'd like to host a call in around 2 weeks time to discuss the status of mev-boost

(and by extension the relay and builder implementations). i will return with an exact time once i have more clarity on some agenda items but the call will be early february (week of the 6th or potentially in the first few days of the month).

i am posting this now so i can circulate to all the relevant parties and soft-reserve some calendar time. timezone-wise i'm thinking around 2 or 3pm UTC. please comment if you would prefer a different time of the day.

as for the agenda:

1. builder-specs

update for capella

hard fork

1. builder-specs

update for deneb

(EIP-4844) hard fork

1. relay and builder implementation-readiness for the capella

hard fork

1. testing and security updates
2. open time for research updates or discussion around mev-boost

and builder ecosystem

i have a few more agenda items in mind around my thinking for a mev-boost

roadmap this year and will update here once they are more concrete. if you have anything you'd like to discuss, please comment below.

excited to chat with you all
