

GMX just finished creating a BNB Market on GMX V2 (Arbitrum), which is a monumental feat - wBNB is compatible with IBC protocol, and there's been so much buzz/speculation momentum within that ecosystem.

As we gear up for potential "risk-on" conditions, wanted to open a discussion surrounding GMX V2 vaults for bridged:

COSMOS (wrapped ATOM)

CELESTIA (wrapped TIA)

POLKADOT (potentially wrapped DOT)

Would appreciate any/all feedback from the community,

Thank you
