

[AnchorVault integration](#), allowing users to use stETH as a collateral on Anchor Protocol on Terra, distributes daily rewards through the market sell of extra stETH to UST. Due to the extreme market situation around UST, this operation can't be executed without extreme slippage: see [Curve pool](#). In order to prevent UI & the smart contracts from blocking withdrawal of user funds, the RewardsLiquidator contract settings are set to allow for the full 100% slippage.

While the dev team is working on designing the fix for the integration, please, [convert your bETH to stETH](#) to prevent the rewards accrued on stETH deposited to the AnchorVault from being lost.
