

It seems like just about every business day, there should be some NMR burned from between the tournament and the erasure platform. If you look at the NMR contract on any of the ether blockchain readers out there, the supply of NMR hasn't moved over the last few days.

<https://etherscan.io/token/0x1776e1F26f98b1A5dF9cD347953a26dd3Cb46671#tokenAnalytics>

The above site, for example, is one example that has displayed 10,987,476.06... as the total supply of these tokens, and that hasn't changed for a couple of days, one of which I had some burned in the tournament.

I'm just wondering if daily burns directly translate to a reduced supply of the NMR token (my current understanding), and if so, when is that viewable on tools that evaluate the status of the NMR token?

Thanks in advance on any clarification.
