

Hi everyone,

I wanted to bring to your attention a case earlier published by our colleagues at Lido, which can be found here [Lido permit front-running](#).

This issue has also been observed in other protocols. For instance, 1Inch is planning an update to their contract, details of which are available here: [1Inch tryPermit update](#).

Given these developments, I urge the Maker DAO community to review and ensure that the system is not at risk from similar vulnerabilities.

Looking forward to your feedback.
