

Client

Transactions

The Interchain Transactions module only processes messages from smart contract addresses and does not have anytx CLI entry points.

Queries

The query commands allow users to query the module.

simd query bank --help

interchain-account

Theinterchain-account command allows users to query the interchain account address for a combination of owner-address, connection-id and interchain-account-id:

neutrnd query interchaintxs interchain-account [owner-address]

[connection-id]

[interchain-account-id]

[flags] * owner-address * is the address of the contract that registered the account; * connection-id * is the identifier of the connection used to register the account; * interchain-account-id * is the identifier chosen by the contract for a specific interchain account.
