

Just some loose thoughts that might open up some interesting discussion since it seems like SUAVE is taking a different perspective:

Intents won't be that useful for MEV searching because if there is value to capture, the solvers would just keep it for themselves. Even if the user placing the intent, offered to pay the solver on some utility curve for the quality of execution of their strategy, they won't be able to pay enough for it to +EV for both the solver and the "intender". This is because MEV searchers are probably the most unbiased, rational actors in all of crypto - they care about profit above all else.
