

1. It is unlikely someone will have the exact same model as yours
2. There is value in having more stake value on the same model by potentially many people, namely a sign of confidence in the model (e.g. the example model). Conversely if the stakes are wrong, they will burn.
3. Sharing of good quality code is beneficial to the community in that people make better models and the meta model improves, as long as it does not lead to hyperparameter-level duplications.

Hope these help.
