## Migrate to v3

This guide references the major changes between v2 and v3 to help those migrating an existing app.

### Remove the adapters

We have removed the concept of adapters from theprotocol-kit to simplify the library. Instead of using specific library adapters, we use now an internalSafeProvider object to interact with the Safe. ThisSafeProvider will be created using:

- An Ethereum provider, an[EIP-1193\(opens in a new tab\)](#)
- compatible provider, or an RPC URL.
- An optional address of the signer that is connected to the provider or a private key. If not provided, the first account of the provider (eth\_accounts
- ) will be selected as the signer.

These changes affect the creation of theSafe4337Pack instance, as it was previously using anethAdapter compatible object.

```
_10 // old _10 const safe4337Pack = await Safe4337Pack.init({ _10 ethAdapter: new EthersAdapter({ ethers,
signerOrProvider }), _10 // ... _10 }) _12 // new _12 const safe4337Pack = await Safe4337Pack.init({ _12 provider:
window.ethereum, // Or any compatible EIP-1193 provider, _12 signer: 'signerAddressOrPrivateKey', // Signer address or
signer private key _12 // ... _12 }) _12 _12 const safe4337Pack = await Safe4337Pack.init({ _12 provider: 'http://rpc.url', // Or
websocket _12 signer: 'privateKey', // Signer private key _12 // ... _12 })
```
