

# New Network Requests

The following are the evaluation criteria UMA considers when adding Optimistic Oracle support for a new network. UMA aims to support as many networks as possible to deliver the best experience for our integrating protocols and users. However, integrating a new network requires a significant investment. Therefore, the evaluation criteria were established to ensure that the benefits to UMA's integrating protocols and users outweigh the development, security, and operational costs of adding a new network.

Please note that these requirements are subject to change as the EVM (Ethereum Virtual Machine) and Layer 2 ecosystem continue to evolve. Meeting these requirements is the initial step in our evaluation process and does not guarantee support.

Non-Negotiable Criteria:

The below are a pre-requisite to any consideration:

- EVM-Compatible Network a canonical token and message bridge to mainnet
- $\geq 2$  or more Independent RPC Node Providers (without block range limits for log queries)
- 30-Day Moving Average TVL on the network  $> 75M$
- Block Explorer with Etherscan-Compatible API, contract verification and ABI fetching
- Availability of token mappings data source with Ethereum mainnet
- Dedicated support channel containing technical members of the network with priority support commitment to advise on contract development and debug data quality
- Subgraph support for testnet and mainnet
- Wallet connector libraries support for testnet and mainnet
- 

Additional Criteria for oSnap Support:

- Snapshot network support for testnet and mainnet
- SAFE App support for testnet and mainnet
- - Requires app opener with deep linking and transaction service
- \*
- Zodiac support for testnet and mainnet
- Support for [Covalent service](#)
- - Required for balance fetching in transaction builder
- \*
-
