

# Bundler FAQs

## **I successfully submitted a user operation to the bundler, but it never got included in a block. What happened?**

There can be many reasons for this. The most common are:

- The user operation succeeds as it is being validated, but fails during the second round of simulations when it is being bundled by the bundler into a transaction to be submitted on-chain and is therefore dropped.
- The bundle transaction bundling the user operation fails on-chain so no logs are emitted.
- You submitted a user operation which has a nonce that is higher than the current account nonce, which means it is likely queued by the bundler until that nonce is reached.

It is recommended to use the [pimlico\\_getUserOperationStatus](#) endpoint to check the status of your user operation.

## **What is the difference between v1 and v2 endpoints?**

V1 is for bundlers, while v2 is for paymasters. V2 for bundlers will be released soon with a notice period for migration.

## **What are fees to deploy to app-chains?**

Fees vary by network. Please reach out to [us](#) for more information.
